

AficionaDAO

Money, Cash, Capital, Currency & The Freedom Of Choice

We are born into a world where we have limitations placed upon us as to what constitutes value and as such, the means as to how we transact with one another.

This isn't a story about the evils of fiat, nor the merits of crypto. We use Ether because it has gained the most widespread adoption. By using Ethereum we have of course contributed to this adoption, but in the same breath we wouldn't boast of our contributions to the monetary system by the use of our dollars so let's stay away from the fairytales and get back to the sobering realities.

We have already discussed above that we lack freedom of choice in both our fiat and blockchain "means of exchange", but the reality is we have far less freedom of choice in blockchain than in fiat.

Why? How? You might be asking. Well the inconvenient truth of the matter is that with fiat we have the ability to spend our money in establishments or with people where we know we won't be disturbed by... those less fortunate. This isn't a blame game, classist, or an attack on the poor. This is just a recognition that some of us, for once in our crypto lives, want to deal with real intellectual people, where we know damn well the person we are speaking with has at least a certain level of intelligence to be able to have earned themselves enough money to have the privilege of being amongst equals. Yes of course some get lucky or are born into wealth, and others have supreme intellect without the want or aspirations for money, but in general it is a very good filter for the purposes of our DAO.

Let's face it. Can you imagine the bliss of being in a telegram group or Discord and not having to deal with all the menial bullshit of idiots who buy more than they are willing to lose & then make it their business for everybody in the world to hear about it?

To not have to have the same twats comment on every social media post about how they have been scammed because the token went from \$1.00 to \$0.90?

Anybody who has been in crypto for more than one cycle, or even one year should know that it is a seemingly unwritten law of crypto; **The people with the least money on the line cause the most grief.**

This token or introduction isn't trying to explain the sociological reasons for the above statement. Yes, maybe they are the most disruptive because they have the most to lose as a percentage of their wealth. Or maybe they are the most disruptive because they are used to "fighting it out" in their daily lives.

Frankly we couldn't give a flying fuck. We're sorry to hear about your struggles, but they aren't our problem so piss off back to BSC with them and stop making your problems our problems.

Glad to get that part off of my chest and apologies for the language.

AficionaDAO

Our plan is simple.

We implement a minimum buy for our token. We have to take into account that smart people may not risk thousands on brand-new experimental tokens and so we will have a tiered system as to how we set our minimum buy.

We propose the following:

Minimum Contribution to token sale at IDO 0.2 Ether.

This minimum will rise by 0.1 Ether every 24 hours thereafter until it reaches 0.5 Ether minimum.

There will be no buy or sell tax however we will have a hefty 25% transfer tax. Why is this? Two reasons.

1. We don't want an OTC market forming for our token where poor plebs can purchase smaller amounts from those with more cash.
2. We don't want exchanges listing our token without our permission just to have them dump on us and screw our price. The only people who think tier two exchanges are bullish for a tokens price are idiots, and the point of this token is to get rid of idiots.

The 25% transfer tax will go to a treasury for us smart people in the DAO to do smart things with. 10% burned and 15% is swapped to WETH and sent to the treasury.

We are building this as a fully automated and fully decentralized application so eventually all functions will be able to be called upon by the DAO as governance functions. We will make the following amendable by the DAO;

- Minimum buy amount in Ether
- Addresses that can be whitelisted to remove transfer tax
- Access to DAO treasury.

AficionaDAO

Internal Rankings

- A Prestige within the DAO is to be recognized and so we have our own in-DAO richter scale.
- All \$ADAO owners are Aficionados
- All \$ADAO owners holding above 5 Ether worth are Aficionadas
- All \$ADAO owners holding above 50 Ether worth are the Aficionadist.
- The Aficionadist are mysterious beings who plebs worship upon seeing their wallets on bobby buy bots everywhere. All hail the Aficionadist and pray they bless your bobby with their bountiful presence.
- God like creatures who don't even necessarily exist as if they did they would be too chadly to ever be gazed upon by the human eye.

NFT/Token Economy & Treasury Growth Strategy

- Any ADAO token holder can mint just one free ADAO NFT.
- This NFT provides its holders with governance powers as well as being the treasury reward distribution mechanism, aka, you need to mint the NFT to benefit from any treasury transactions or profits/redistributions of any kind.
- This NFT also has transfer permissions on the full amount of the ADAO token holders \$ADAO.
- If the NFT is sold 98% of \$ADAO is also transferred to the NFT recipient's wallet. With the other 2% of the ADAO sold for \$WETH and sent to the treasury. This gives holders, market makers or anybody with the technical know how, the ability to profit from arbitrage strategies across NFT & Token, thus providing volume & WETH to the treasury.
- If any NFT owner sells any amount of \$ADAO, their NFT is burned, and another NFT is minted under a new collection owned by the treasury called "The Special Fallen Ones".
- These NFTs are sold by the DAO with 90% going to treasury & 10% to AficionaDAO development.

The Special Fallen Ones

- "The Special Fallen Ones" NFT owners are the treasury managers of the DAO. Only these NFT holders are able to be set as recipients of the Treasury funds and manage the investments. Rewards from investments are distributed to the Governance NFT holders.
- 2% of the Treasury per annum is shared amongst holders of "The Special Fallen Ones" as a reward for the treasury management duties. This is paid out in monthly instalments (2% of total balance divided by 12) direct from the treasury wallet.
- The DAO has the ability to change the reward/management % sent to the special fallen ones. Where this may seem, to the uneducated pleb, that "well let's set it as low as possible then"... in reality as "The Special Fallen Ones" are the core treasury building component, their desirability is directly related to the DAOs ability to build treasury, and in turn, earn rewards.
- The % paid will be a key driver of floor price & thus how quickly & to how large the treasury can become. This will be a fine balance for the DAO to consider.
